A new minor histocompatibility antigen, diseases and prevent rejection and host marrow and organ transplantation. HA-1 - useful to treat immune versus graft disease in bone

Disclosure; Page 15; 47pp; English.

The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency

                                                                                                                                                                                                              The present sequence represents part of the minor histocompatibility antigen HA-1 R-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of geneetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies
                                                                                                                                                                                                                                                                                                                                                                              Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. det of genetic aberrances.

The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency

The invention relates to a novel method for providing epitopes of allelic variants of antigenic proteins from specific species based on single nucleotide polymorphism (SNP), by defining target protein, peptide or its subset, screening database of DNA encoding target protein, identifying, selecting allelic peptide/protein variants, expression product or its fragment encoded by DNA sequence having SNP, creating variant epitopes, selecting epitopes binding to MHC protein. A protein of the invention has cytostatic activity, and may have a use in a vaccine. The method is
                                                                                                                                                                                                  Providing allelic variant epitope of protein based on single nucleotide polymorphism by defining target protein, screening database of protein, identifying, selecting allelic variant protein, creating variant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe aplastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful for generating a SNP profile of one or more individuals from a given species by applying the method for several protein from the individuals, where the SNP profile was related to disease, preferably cancer. This is useful for diagnosing a disease in an individual by generating the SNP-related polymorphic profile. A method of the invention is useful for transplanting haematopoletic stem cells from a donor to a recipient and treating cancer, preferably leukaemia, and for determining the progression, regression or onset of a treated disease. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

                              diseases
                                                      The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the
                                                                                                                                                                                                                                                                                                                                                                                    04-FEB-1999

                                                                                                                                                                                                                                                                                                          닭
                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                              This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein I and CC SH (also known as the 1A proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC composition comprising an above peptide mixed with a pharmaceutical CC excipient or an RSV immunogenic composition comprising a recombinant CC expression vector with a nucleic acid insert encoding an above peptide. CC Thymphocytes (CTIs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC RSV peptide is useful for preparing a diagnostic composition or an RSV (prophylactic or therapeutic) vaccine composition for a DNA-based CC immunisation, or for preparing an immune response provoking vaccine in CC the event of RSV infection (the vaccine being prepared by contacting the CC polypeptide in an immune response-provoking anount of specific CTI).

CC Accordingly, these peptide compositions have virucidal activity. This cc invention.
                                                                                                                                                                                                                                          Query Match

Specifically, it refers to a CC composition comprising an above peptide mixed with a pharmaceutical CC excipient or an RSV immunogenic composition comprising a recombinant CC expression vector with a mucleic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC Tlymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC (prophylactic or for preparing an immune response provoking vaccine in the event of RSV infection (the vaccine being prepared by contacting the conjpeptide in an immune response-provoking amount of specific CTL). CC peptide sequence is a human RSV high binding affinity peptide of the

This invention relates to novel isolated or purified peptides of the

Sequences AAU71093-AAU71796 represent the 103P3E8-related protein peptide fragments of the protein. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3888888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein L and CC eight structural proteins preferably G, also M, M2-1, M2-2, N, p, p, and CC composition comprising an above peptide mixed with a pharmaceutical CC excipient or an RSV immunogenic composition comprising an above peptide cC expression vector with a nucleic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC Thymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The CC (Prophylactic or therapeutic) vaccine composition for a DNA-based CC (Prophylactic or therapeutic) control (the vaccine being prepared by contacting the vent of RSV infection (the vaccine being prepared by contacting the CC polypeptide in an immune response provoking amount of specific CTL).

CC Accordingly, these peptide compositions have virucidal activity. This competition is a human RSV high binding affinity peptide of the

encoding II separate viral proteins: non-structural proteins NS-1 (also known as the IC protein) & NS-2 (IB protein), a polymerase protein I and eight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and SH (also known as the IA protein). Specifically, it refers to a composition comprising an above peptide mixed with a pharmaceutical excipient or an RSV immunogenic composition comprising a recombinant expression vector with a nucleic acid insert encoding an above peptide. The present invention describes an in vitro method of detecting cycotoxic T lymphocytes (CTLs) that respond to a major histocompatibility complex (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The RSV peptide is useful for preparing a diagnostic composition or an RSV (prophylactic or therapeutic) vaccine composition for a DNA-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103938 polymucleotide, its relate protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 1039388 related protein, and a ribozyme capable of cleaving a polymucleotide having the 1039388 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 1039388. The sequences can be used in diagnostic methods to monitor the level of 1039388 gene products in secun, blood, urine and tissue and to thereby detect the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel isolated or purified peptides of the human respiratory symcytial virus (RSV), in particular ten RSV genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       preventing

CC This invention relates to novel isolated or purified peptides of the CC human respiratory syncytial virus (RSV), in particular ten RSV genes CC encoding 11 separate viral proteins: non-structural proteins NS-1 (also CC known as the 1C protein) & NS-2 (1B protein), a polymerase protein L and CC sight structural proteins preferably G, also M, M2-1, M2-2, N, P, F, and CC SH (also known as the 1A protein). Specifically, it refers to a CC composition comprising an above peptide mixed with a pharmaceutical CC expression vector with a nucleic acid insert encoding an above peptide. CC The present invention describes an in vitro method of detecting cytotoxic CC Tlymphocytes (CTLs) that respond to a major histocompatibility complex CC (MHC) class I restricted T-cell stimulating peptide epitope of RSV. The RSV peptide is useful for preparing a diagnostic composition or an RSV CC (prophylactic or therapeutic) vaccine composition for a DNA-based CC immunisation, or for preparing an immune response provoking vaccine in CC the event of RSV infection (the vaccine being prepared by contacting the CC polypeptide in an immune response-provoking amount of specific CTL). Accordingly, these peptide compositions have virucidal activity. This contacting is a human RSV high binding affinity peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ភភភភភភន្ត្

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

Sequence 4, Application US/09489760

Patent No. 6878375

GENERAL INFORMATION:
APPLICANT: Rijksuniversiteit Te Leidin
APPLICANT: Hunt, Elsa A.J.M

APPLICANT: Hunt, Donald F

APPLICANT: Heard, Victor H

TITLE OF INVENTION: The HA-1 Antigen
FILE REFERENCE: 2183-4285US

CURRENT APPLICATION NUMBER: US/09/489,760

CURRENT FILING DATE: 2000-01-21

EARLIER APPLICATION NUMBER: PCT/NL98/00424

EARLIER FILING DATE: 1998-07-23

NUMBER OF SEQ ID NOS: 16

SOFTWARE: Patentin Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 11

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq length: 0 seq length: 9

Publication No. US20050266518A1

GENERAL INFORMATION:

APPLICANT: BERTY, Alan

APPLICANT: HUMBELLN, Markus

APPLICANT: HUMBELLN, Markus

APPLICANT: LOPEZ-ULIBARRI, Rual

APPLICANT: YELISETY, Alexei A.

TITLE OF INVENTION: IMPROVED ISOPRENOID PRODUCTION

FILE REFERENCE: C38435/121966

CURRENT APPLICATION NUMBER: US/11/129,143

CURRENT FILING DATE: 2005-05-13

NUMBER OF SEQ ID NOS: 197

SOFTWARE: Patentin version 3.1

LENGTH: 5

TYPE: PRT

ORGANISM: Bacillus stearothermophilus
